Mean 10.607; Variance 5.121; scale 2.071

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The source of human erbB-2 protein for the prodn. of antibodies no 23 and 21 (055180/R45442; 055181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. I animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

A nucleic acid comprises a first sequence encoding a signal peptide (R94019) linked to a second sequence (T17728) encoding a single chain Fv fragment (R94020) that binds a human erbB2 oncoprotein. The anti-erbB2 sFv portion is obtained by PCR using e33sCFv plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Curiel DT, Deshane J; WPI; 96-171307/17.

                                                                                                                                                                                                                                                                                                                                                                                           Producing single chain Fv antibody in Escherichia coli - by expression in an inclusion body, followed by protein folding or by co-expression with a chaperonin as a soluble fraction co-expression with a chaperonin as a soluble fraction co-expression with a chaperonin as a soluble fraction color of the sequences given in T91614-15 encode single chain Fv (scFv) cantibodies which are produced in E. coli. The scFv's are derived from an anti-T3 antibody or an anti-T9130 antibody and are produced cither by: (1) expression as an inclusion body, followed by folding (i.e. by denaturation and solubilisation) or (2) expression as a soluble fraction by co-expression with chaperonin. Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δõ
                                                                                                                                                                                              Fig. 1. Single chain antibodies specific for erbB-2 protein, gp185 - with abels or cytotoxin, useful for detection and treatment of tumour cells expressing this protein

Fig. 2. Example 9: Columns 27-30: 28pp: English.

The present cDNA sequence codes for a claimed single-chain antibody, compared e21(Fv), which binds to erbB-2. Monoclonal antibody e21

Cate signated e21(Fv), which binds to erbB-2 cells overexpressing the gp185 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-crbB-2 coding for the heavy- and light-chain antibody as isolated and converted to cDNA. Regions coding for the heavy- and light-chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide claim of tumour cells which overexpress the erbB-2 gp185 composis of tumour cells which overexpress the erbB-2 gp185 compared to a cytotoxic agent, to treat such tumours.

C The source of human erbB-2 protein for the prodn. of antibodies no. 22 and 21 (055180/R45442; Q55181/R45443) is a NIH/3T3 cell

C engineered to express the human erbB-2 protein on its surface (N/CC erbB-2). Abs no. 21 and 23 are directed against the extracellular CC domain of gp185 erbB-2. Nude mice manipulated to produce rapidly CC growing tumours were used in a trial of the efficacy of the Abs. If CC engineesed after 11 days.

CC regressed after 11 days.

CC regressed after 11 days.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunosuppressant polypeptide - has ability to block interleukin-2 response
Claim 18; Page 29; 37pp; English.
MAb capable of binding to the gamma chain of the IL-2 receptor, and thus of blocking the IL-2 response, is produced by mouse hybridoma line GP-4 (FERM BP-4640). DNA encoding the variable region of this MAb was expressed in E. coll, yielding Fv(GP-4) with immunosuppressive activity.

Sequence 729 BP; 199 A; 169 C; 182 G; 179 T;
       3H1 heavy chain variable region cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PT Recombinant monoclonal anti-idiotype antibody 3H1 sequences - used to develop prods. for the detection and treatment of carcinoembryonic antigen-associated diseases, partic. cancers PT Carcinoembryonic antigen-associated diseases, partic. cancers PS Claim 6; Fig 2A; 121pp; English.

CC (A cDNA clone (T31541) codes for the heavy chain variable region (CWH) (R98411) of 3H1, a murine monoclonal anti-idiotype antibody that mimics a specific epitope of the 180,000 mol.wt.

CC carcinoembryonic antigen (CEA) and which elicits an immune response in patients with advanced CEA-associated disease, e.g. colorectal cancer. It was obtd. by PCR amplification of 3H1 hybridoma DNA (see also T31545-46). The isolated polynucleotide, and/or a polynucleotide (see also T31540) coding for the VL region (R98410) of 3H1 can be used to design probes and primers, in expression systems, and in pharmaceutical applns, including vaccines, gene therapy and genetic immunisation, partic. against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This con the heavy chain of the heavy chain of this con the region (VH) (see W26729) of murine monoclonal anti-idiotype antibody 3H1. A cDNA sequence (see T99434) for the VL region (see W26728) is also provided. These clones can be utilised in the recombinant production of 3H1 polypeptides. 3H1 induces a specific immune response against a distinct and specific epitope of carcinoembryonic antigen (CEA), a tumour-associated antigen. The invention provides methods of delaying development of CEA-associated tumours using 3H1, particularly in high-risk individuals. The method can be used to delay the development of a variety of tumours, including colorectal, gastric and pancreatic tumours, as well as the colorectal of the seast and lung, and biliary cancer, and gynaecological cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

A cDNA clone (T34542) codes for the heavy chain variable region (R99687) of monoclonal anti-idiotype antibody 3H1 (ATCC HB 1200 It was obtd. by PCR amplification (see also T34543-44) of cDNA derived from 3H1 hybridoma cells. Anti-idiotype antibody 3H1 elicits a specific immune response to a unique epitope of carcinoembryonic antigen (CEA) that is not present on other members of the CEA family or on normal adult tissues. 3H1 can be used as a vaccine to elicit immune responses in patients
                                                                                                      Treating B cell lymphoma with chimeric antibody causing rapid depletion of peripheral B cells, a antibodies and hybridomas Disclosure; Fig 4; 101pp; English.

The sequence is the murine variable region light murine anti-CD20 monoclonal antibody 2BS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-FEB-1995 (first entry)
Murine variable region light chain from 2BS.

TCAEB, a gene encoding a chimeric anti-CD20 anti-CD20 for treatment of B cell lymphomas. TCAEB contains 4 transcriptional cassettes, human Ig light and heavy chain constant regions, dihydrofolate reductase, neomycin phosphotransferase and murine variable regions. The vector can be used to produce antibodies which cause depletion of peripheral blood B cells, including those associated with lymphoma. They mediate complement-dependent lysis and lyse target cells by antibody-dependent cellular cytotoxicity.

C This cDNA seguence encodes a mouse-human chimeric antibody

C light chain (W24532) in which the variable region is derived

CC from mouse anti-human factor IX monoclonal antibody BC2 cDNA (see

CC T79899) and human sequences from the immunoglobulin RF-TS3'CL

CC framework. It was obtained by PCR amplification (see T79897-98)

CC of BC2 cDNA and insertion of the PCR product into F9HZHC 1-3 cDNA

CC (see T77374). Claimed anti-Factor IX chimeric antibodies are

CC useful in the treatment of thrombosis.

CC useful in the treatment of thrombosis.

Claimed humanised antibodies (see W24510-18) contain CDRs (see W24504-09) of BC2 heavy and light chains inserted into framework regions of selected human antibody sequences. They have self-limiting neutralising activity, and are useful as anticoagulant agents in treatment of thrombosis associated with myocardial infarction, unstable angina, atrial fibrillation, stroke, renal damage, pulmonary embolism, deep vein thrombosis, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulation, sepsis, or artificial organs, shunts or prostheses (claimed). Also claimed are chimeric antibodies (see T79900), and Fab and F(ab')2 fragments. The claimed antibodies do not cause uncontrolled bleeding (contrast heparin and warfarin) since they sequence 321 BP; 78 A; 92 C; 79 G; 72 T;
